Capture and analyze network traffic using wireshark

Aim:

To capture and analyze network traffic using wireshark and identify the protocols, and communication between devices.

Procedure:

→ open wireshark on the computer.
→ select the network interface to capture traffic
→ click start capture to begin capturing
→ generate network traffic by browsing networks or using the Ping command
→ Observed the captured packets in the wireshark window.
→ Select a packet to examine its Protocol details and packet
→ Stop the capture and save the capture traffic file if required.

Result:

Thus, network traffic was captured and analyzed successfully using wireshark, and the packets and their corresponding network protocol were identified
