Packet Sniffing using Raw Sockets in Python

Aim:

To implement a Packet Sniffer using raw sockets in Python to capture live network traffic and parse ethernet, IP and transport layer (TCP/UDP/ICMP) headers.

Procedure:

→ Install Python3 on a linux system or virtual machine.

→ Open a terminal with root (sudo) privileges

→ Create a Python file named sniffer.py.

→ import the required modules.

→ create a raw socket using AF_PACKET and SOCK_RAW.

→ Capture incoming ethernet frames from the network

→ Parse the ethernet header to obtain source MAC, destination MAC, protocol type.

→ if the Protocol is IPv4, Parse the IP header

→ Extract IP version, header length, TTL, protocol number, source IP, destination IP.

→ Display the capture Packet information on the screen

Result:

The Packet Sniffer was successfully implemented using Python and Sockets. It captured live network packets and correctly extracted and displayed the ethernet and IPv4 header information, including MAC address, IP address, TTL and Transport layer protocol details.
