Building a Anonymous FTP Scanner using Python

Aim:

To develop a Python based Anonymous FTP Scanner using the built in ftplib module and determine whether an FTP server permits access.

Procedure:

→ Install Python and import FTP module and all avai. classes from Python ftplib module

→ Define anonymous_ftp_scan() to Perform FTP scan.

→ Enter authorised FTP server address and establish a connection to FTP server using Port 21

→ Display FTP server welcome message

→ Attempt anonymous login if login successfull display message access permitted

→ use NLST() to check whether the ~~list~~ directory contents are accessible.

→ Display available directories, handles login or connection are accessible.

→ ~~Display~~ close FTP connection after completing the scan.

Result:

Thus, An Anonymous FTP Scanner was successfully implemented using ftplib module. checked all condition FTP authorised server, anonymous login listing the FTP Servers anonymous access status was successfully determined.
